

Zero Wait Time Virtual Care

Design a virtual care system that scales to meet demand — without compromising safety or clinical quality.

THE CHALLENGE

Design a system that gets members the care they need with **near-zero wait time** — without cutting clinicians out of the decisions that matter. Think beyond the waiting room. The clinical encounter is often fast — the friction lives in everything before the clinician arrives.

NON-NEGOTIABLES

- **Licensed practitioners** must handle all regulated clinical decisions — prescriptions, attestations, diagnoses, etc.
- **Resolution, not routing.** Collecting symptoms is not a solution. Close the loop.
- **Safety guardrails** and escalation paths must be designed in — not bolted on.

WHERE THE OPPORTUNITY LIVES

- **Batching & pre-digestion:** AI prepares a clinical decision packet so clinicians act in minutes, not half-hours.
- **Patient cohorting:** One clinical decision, safely applied to many patients with similar presentations.
- **Async care workflows:** Replace 1:1 real-time consults with structured async paths where appropriate.
- **Eliminating low-value work:** Redesign anything that consumes clinician time without requiring deep medical judgment.

DELIVERABLE

Build a working software prototype with two apps — one for patients, one for care providers. Alongside your code, submit a short demo covering your problem framing, system design, and why your solution achieves “zero wait” while remaining clinically responsible.

Your submission should address:

- How will you keep wait times low as patients scale while providers stay constant?
- Which care services can be delivered without many minutes of provider time? (e.g. med renewals, lab follow-ups, chronic condition check-ins)
- How does the provider app enable one clinician to care for hundreds or thousands of patients daily?

This is a build challenge. We want working software — not just ideas. Bold thinking and real-world constraints, both at once.
